Rickey Rodeffer
Vice President of Certification
Chairman FPCB

Robert J. Sheaf
Director-At-Large
Co-Chairman FPCB

It's Your Career...

It is a lifelong learning process for the professional, regardless of your technical level. There is a major difference between familiarization and training. Those that have obtained "Specialist" Certification would do well to remember that familiarization is not enough for the professional and many seek the mechanic and technician level of certification. Design, installation, startup and maintenance are so very inter-related in the success or failure of any fluid power system. Just being "familiar" with a particular area of a fluid power system is not enough for the professional mechanic or engineer.

The newest certification is the Conductor & Connector. It is intended for the assemblers and fabricators of hose and tubing assemblies. It is, however, a great study for anyone specifying, providing or installing fluid power piping. Certification is invaluable and necessary to you career and being a professional.
