C & C JP TEST STATION 1 LAMINATE 3 OF 3

Code 61 & 62 (Split and One-Piece Clamps)

This connection is commonly used in fluid power systems. There are two pressure ratings. Code 61 is referred to as the "standard" series and Code 62 is the "6000 psi" series. The design concept for both series is the same, but the bolt hole spacing and flanged head diameters are larger for the higher pressure, Code 62 connection.

The female (port) is an unthreaded hole with four bolt holes in a rectangular pattern around the port. The male consists of a flanged head, grooved for an O-Ring, and either a captive flange or split flange halves with bolt holes to match the port. The seal takes place on the O-Ring, which is compressed between the flange head and the flat surface surrounding the port. The threaded bolts hold the connection together.

*SAE J518, JIS B 8363, ISO/DIS 6162 and DIN 20066 are interchangeable, except for bolt sizes

How to Measure Non-Threaded Connections

Four Bolt Flange — First measure the port hole diameter using the caliper. Next, measure the longest bolt hold spacing from center-to-center or measure the flange head diameter.

Dash Numbers

Most fluid piping system sizes in the United States are measured by dash numbers. These are universally used abbreviations for the size of the component expressed as the numerator of the fraction with the denominator always being 16. For example, a -04 port is 4/16 or 1/4-inch. Dash numbers are usually nominal (in name only) and are abbreviations that make ordering of components easier.

This connection is still widely used in fluid power systems, even though it is not recommended by the National Fluid Power Association (N.F.P.A.) for use in hydraulic applications. The thread is tapered and the seal takes place by deformation of the threads.

Measure the thread diameter and subtract 1/4-inch to find the nominal pipe size.

NPTF (National Pipe Tapered Fuel)

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal
1/8	02	1/8 - 27	13/32	0.41	3/8	0.38
1/4	04	1/4 - 18	17/32	0.54	1/2	0.49
3/8	06	3/8 - 18	11/16	0.68	5/8	0.63
1/2	08	1/2 - 14	27/32	0.84	25/32	0.77

1 1/2	24	1 1/2 - 11 1/2	1 29/32	1.90	1 13/16	1.82
2	32	2 - 11 1/2	2 3/8	2.38	2 5/16	2.30

This connection is sometimes used in fluid power systems. The female half has a straight thread and an inverted 30° seat. The male half of the connection has a straight thread and a 30° internal chamfer. The seal takes place by compression of the 30° seat on the chamfer. The threads hold the connection mechanically.

Note: A properly chamfered NPTF male will also seal with the NPSM female.

NPSM (National Pipe Straight Mechanical)

SAE J514 Straight Thread O-ring Boss (ORB)

This port connection is recommended by the NFPA for optimum leakage control in medium and high-pressure hydraulic systems. The male connector has a straight thread and an O-ring. The female port has a straight thread, a machined surface (minimum spotface) and a chamfer to accept the O-ring. The seal takes place by compressing the O-ring into the chamfer. The threads hold the connection mechanically.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)

SAE J514 37°* Hydraulic

This connection is very common in fluid power systems. Both the male and female halves of the connections have 37° seats. The seal takes place by establishing a line contact between the

male flare and the female cone seat. The threads hold the connection mechanically. **Caution:** In the -02, -03, -04, -05, -08 and -10 sizes, the threads of the SAE 45° flare and the SAE 37° flare are the same. However, the sealing surface angles are not the same.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)

*This connection was formerly known as JIC.

ORS/ORFS SAE J1453 O-ring Face Seal

This connection offers the very best leakage control available today. The male connector has a straight thread and an O-ring in the face. The female has a straight thread and a machined flat face. The seal takes place by compressing the O-ring onto the flat face of the female, similar to the split flange type fitting. The threads hold the connection mechanically.

Inch size	Dash size	Nominal Thread size	Male Thread OD (inch)		Female Thread ID (inch)

1 1/2	24	2 - 12	2	2.00	1 15/16	1.92

SAE J512 Inverted

This connection is frequently used in automotive systems. The male connector can either be a 45° flare in the tube fitting form or a 42° seat in the machined adapter form. The female has a straight thread with a 42° inverted flare. The seal takes place on the flared surfaces. The threads hold the connection mechanically.

Inch Size	Dash Size	Nominal Thread Size	Male Thread OD (inch)		Female Thread ID (inch)	
			Fraction	Decimal	Fraction	Decimal

SAE J512 45°

This connection is commonly used in refrigeration, automotive and truck piping systems. The connector is frequently made of brass. Both the male and female connectors have 45° seats. The seal takes place between the male flare and the female cone seat. The threads hold the connection mechanically.

Caution: In the -02, -03, -04, -05, -08 and -10 sizes, the threads of the SAE 45° flare and SAE 37° flare are the same. However, the sealing surface angles are not the same.

SAE J1467

This is a radial O-Ring seal connection developed in Germany and commonly used for hydraulic applications in underground mines. The male contains an exterior O-Ring and backup ring, plus a groove to accept the "staple". The female has a smooth bore with two holes for the staple. A "U" shaped retaining clip or staple is inserted through the two holes, passing through the groove in the male to lock the connection together. The seal takes place by contact between the O-Ring in the male and the smooth bore of the female. Many manufacturer's of hose ends and fittings provide products based on this design which is commonly referred to as Staplok. Staplok is a registered trademark of Aeroquip Corporation.

Code 61 & 62 (Split and One-Piece Clamps)

This connection is commonly used in fluid power systems. There are two pressure ratings. Code 61 is referred to as the "standard" series and Code 62 is the "6000 psi" series. The design concept for both series is the same, but the bolt hole spacing and flanged head diameters are larger for the higher pressure, Code 62 connection.

The female (port) is an unthreaded hole with four bolt holes in a rectangular pattern around the port. The male consists of a flanged head, grooved for an O-Ring, and either a captive flange or split flange halves with bolt holes to match the port. The seal takes place on the O-Ring, which is compressed between the flange head and the flat surface surrounding the port. The threaded bolts hold the connection together.

*SAE J518, JIS B 8363, ISO/DIS 6162 and DIN 20066 are interchangeable, except for bolt sizes.

Steel Tubing Data

Steel tubing is called out by outside diameter and wall thickness. For hydraulic plumbing, use a low carbon seamless steel tubing which can be bent and flared without cracking. Order "hydraulic grade" tubing. Pressure ratings in this table are based on a tubing with tensile strength of 55,000 PSI, and were calculated by Barlow's formula: $P = (2t \cdot S) / O$, in which P = burst strength in PSI, t = wall thickness, S = tensile strength in PSI, and O = outside diameter. This formula may be used to calculate tubing sizes not listed. For pressure rating at other safety factors, take burst PSI and divide by desired design factor.

Tube Dimensions (English)				Carbon Steel			Stainless Steel		
Tube OD	Wall Thickness	Tube ID	ID Area (sq-in)	CS Burst Pressure	WP - 6:1 (psig)	WP - 4:1 (psig)	SS Burst Pressure	WP - 6:1 (psig)	WP - 4:1 (psig)

STATION #5

DIAGNOSTICS

NOTE: Only the information shown on the drawings is to appear on the test hoses. Holes drilled in hose and fitting are for tagging - not to be considered defects.

TOOLS NEEDED:

- Dial Caliper

LAMINATED CHARTS:

- 2 Skive and Crimp Data

C & C JP TEST STATION 5 - LAMINATE 1 OF 2

Hydraulic Hose With Skive Type 2-Piece Couplings **Important**

To assure a quality assembly, check the first assembly of each run. Measure the crimp O.D. and the crimp length and compare them with the figures listed in the "crimp diameter" column. If the ACTUAL crimped dimensions are within .005" of the specified crimp dimension, you have made a good setup (the crimp tolerance of + or - .010" covers running variation).

ALL DIMENSIONS ARE IN INCHES

STATION #6

BEND, FLARE, AND INSTALL TUBE

TOOLS NEEDED:

- Fixture for tube attachment
- 3/8" hand bender with 15/16" radius
- 3/8" flare tool
- Tube cutter
- Deburring tool
- Metal file
- Steel framing square
- Felt marking pen

LAMINATED CHARTS:

- 4 Laminated Instruction Sheets

STATION 6 | C & C JP TEST - LAMINATE 1 OF 4

As long as tubing is measured and bent in the same direction, and is measured centerline to centerline, "pickup" will not affect the actual center-to-center measurement.

Nominal Tubing Gain vs. Radius Block Size						
Bend Angle	Tube OD, in					
	1/8	1/4	1/4	5/16	3/8	1/2
	Bend Radius, in					
	9/16	9/16	3/4	15/16	15/16	1 1/2
30°	0	0	0	0	0	1/16
45°	1/16	1/16	1/16	1/16	1/16	1/16
50°	1/16	1/16	1/16	1/16	1/16	1/8
55°	1/16	1/16	1/16	1/8	1/8	1/8
60°	1/16	1/8	1/16	1/8	1/8	3/16
65°	1/8	1/8	1/8	3/16	1/8	1/4
70°	1/8	1/8	1/8	3/16	3/16	5/16
75°	1/8	3/16	3/16	1/4	1/4	3/8
80°	3/16	3/16	3/16	5/16	5/16	7/16
85°	1/4	1/4	1/4	3/8	3/8	9/16
90°	1/4	5/16	5/16	7/16	7/16	11/16

Note: Many manufacturers of tube bending equipment publish gain tables. Often, these tables are based on the design and performance characteristics of the tube bender and not the true calculated value required to perform the bend. As a result, values provided in the gain table may not match the mathematically calculated value, but will be accurate when using both a specific manufacturer's tube bender and associated gain table. The table above illustrates a typical manufacturer's gain table.

Pre-measuring Bends

A series of bends may be pre-measured. Measure the first bend the correct length. Compensate for each bend after the first by subtracting the amount of gain from the chart for each 90° of bend to allow for stretch. Always custom measure for the last bend to allow for flaring. Making a 3/8 tube assembly with the first bend at 4 inches and the remaining bends at 4 1/4 inches (subtract gain from desired bend length to mark the measurements before bending).

STATION 6 | C & C JP TEST - LAMINATE 2 OF 4

The Hand Bender: The RADIUS BLOCK OR BENDING BLOCK

Fig. 1

Fig. 2

The radius block, as shown above, is the part of the bender that is a semi-circle block with a round groove on its edge equal to the diameter of the tube to be bent. The radius block also has a flat side, which is fastened to the rigid or holding handle. The tube clamp is usually part of the block or attached to the handle at the block. This radius block has the actual radius of the block stamped on the side. For a 3/8" diameter tube bender, 15/16" radius is the most common block used. The radius block also has numbers and marks stamped at specific points along its edge; these are reference points for various angles.

Clamp

This is affixed to either the radius block and/or the rigid handle and is used to hold the tube in place while bending. This device may be either part of the handle or attached to the handle.

Bending Handle

This handle is attached to the radius block by means of a link. It has a companion groove the same diameter as the tube to be bent. There are marks and numbers stamped on the block end of this handle (see Fig. 2). These are the reference marks used in the bending process.

Terms used in bending

Centerline of the Tubing

The centerline of the tubing is an imaginary line drawn along the radius point of the tube diameter at one end to the radius point of the tube diameter at the other end.

Fig. 3

Changes of Plane and/or Direction

Think of the tube as having an imaginary line drawn on the outside from one end to the other. (See Fig. 3) This could be considered as the main plane of the tubing. Changes of plane are accomplished by rotating the tube in the bender.

Note: On Fig. 1 the marks "L" and "R" are used depending on whether the mark on the tube is measured from the left "L" or from the right "R". See Fig. 4 and Fig. 5.

Fig. 5

45° Bend Guidelines

Example of the measure-bend method:

A 90° bend 4 inches from the reference mark followed by a 45° bend with 4 inches between bends.

1. Place a reference mark at the end of the tube from which you are beginning the measurements.
2. Measure 4 in from the reference mark to indicate the first desired bend and make a bend mark length.
3. Bend the tube 90°.
4. Make a second bend mark 4 in from the vertex of the 90° bend, away from the reference mark.
5. Place a directional mark over the bend mark to indicate the outside, or heel, of the 45° bend. This will help ensure the bend is made in the intended direction.

6. Bend the tube 45°.

Offset Bend Formula

The purpose of an offset bend is to change the center line of the run, typically to avoid an obstruction. To determine the length of offset, select the offset angle (E). Then, multiply the offset dimension (O) by the offset bend allowance (A).

$$L = O \times A$$

Use the offset calculation as the distance between the bend marks described in Bend Layout.

Offset Bend Angle (E)	Offset Bend Allowance (A)
22 1/2 °	2.613
30 °	2.000
45 °	1.414
60 °	1.154

Example

Offset bend angle (E) 45°
 Offset dimension (O) 6.75 in.

$$6.75 \times 1.414 = 9.55 \text{ in, or approximately } 9 \frac{9}{16} \text{ in.}$$

Operating Instructions:

1. Cut and ream tubing.
2. Back off feed screw handle and clamp screw to permit flaring bars to slide freely through yoke. Slide yoke to hinged end of flaring bars.
3. Insert tube into proper size opening and close flaring bars. Push tube up from bottom of tool until it is even with top of flaring bars.

NOTE! OVERSIZE or UNDERSIZE flares can be made by adjusting tube position slightly above or below the top of flaring bars.

4. Slide yoke forward over tube until arrow on yoke meets line on flaring bars. Tighten clamp screw firmly.
5. Turn the feed screw handle clockwise until pressure kick-out releases. A few additional turns before backing off will burnish flare.
6. Back off feed screw handle as far as it will go. Release clamp screw and slide yoke back. Remove tube. If tube tends to stick, tighten clamp screw against tapered end of bars. This action will force bars open.
